After you have mastered the basics of Flash, and have a good understanding of animation, symbols, and basic ActionScripting, it's time to expand on those skills with Macromedia Flash MX 2004 Beyond the Basics Hands-On Training. There is a giant gap that exists with Flash training resources. Content is geared either towards beginners or advanced developers. This book was crafted to bridge that gap and provide a way for beginning designers and developers to further their Flash knowledge without leaping into the Advanced realm of pure ActionScripting. This book teaches intermediate-level techniques and ActionScripting in the context of building a Web site, entirely within Flash. It's one thing to understand how basic animations and ActionScripting work, it's an entirely different matter to put all those pieces together to build a coherent Web site. This book not only focuses on site construction techniques, but also on learning more advanced ActionScripting; thus bridging the great divide between Learning and Advanced content. You will also learn how to dynamically load in text and images, format dynamically loaded text using HTML, CSS, and nested images, create scrollable text, build a preloader, add music and allow the user to control its volume, add video and allow the user to control its playback, build a slideshow, build a feedback form, create a Flash plugin detector, and more. The accompanying CD-ROM includes a complete set of starter and finished exercise files to accompany all projects in the book, plus dozens of QuickTime tutorials.
